# The Egyptian Tangram

# The Egyptian Tangram

---

A square dissection firstly proposed as a tangram in:

Luna-Mota, C. (2019) *"El tangram egipci: diari de disseny"* Nou Biaix, 44

# Origins

---

The Egyptian Tangram inspiration comes from the study of two other 5-piece tangrams...

The “Five Triangles” & “Greek-Cross” tangrams

# Origins

---

...and their underlying grids

The “Five Triangles” & “Greek-Cross” underlying grids

# Design Process

---

The Egyptian Tangram was the result of an heuristic incremental design process:

Take a square and keep adding “the most interesting straight cut” until you have a dissection with 5 or more pieces.

# Design Process

---

To make an Egyptian Tangram:

1. Connect the midpoint of the lower side with the upper corners.
2. Connect the midpoint of the left side with the top right corner.

# Antecedents

---

It turns out that this figure is not new...

See problem 3 from:

Detemple, D. & Harold, S. (1996) *"A Round-Up of Square Problems"*  
Mathematics Magazine, 69:1

...but, to the best of our knowledge,  
nobody used it before **as a tangram**

# Antecedents

---

The name is not new either...

This dissection is often called “Egyptian Puzzle” or “Egyptian Tangram”

...but there is a good reason to consider  
our dissection the real “Egyptian Tangram”

(even if it was designed in Barcelona)

# Antecedents

---

The underlying grid is also a well known figure:

Brunés, T. (1967) *"The Secrets of Ancient Geometry – and Its Use"*

Bankoff, L. & W. Trigg, C. (1974) *"The Ubiquitous 3:4:5 Triangle"*,  
Mathematics Magazine, 47:2

# The pieces

- Just five pieces
- All pieces are different
- All pieces are asymmetric
- Areas are integer and not *too different*
- All sides are multiples of 1 or  $\sqrt{5}$
- All angles are linear combinations of  $90^\circ$  and  $\alpha = \arctan\left(\frac{1}{2}\right) \approx 26,565^\circ$

Name	Area	Sides	Angles
T1	1	1, 2, $\sqrt{5}$	$90^\circ$ , $\alpha$ , $90^\circ - \alpha$
T4	4	2, 4, $2\sqrt{5}$	$90^\circ$ , $\alpha$ , $90^\circ - \alpha$
T5	5	$\sqrt{5}$ , $2\sqrt{5}$ , 5	$90^\circ$ , $\alpha$ , $90^\circ - \alpha$
T6	6	3, 4, 5	$90^\circ$ , $90^\circ - 2\alpha$ , $2\alpha$
Q4	4	1, 3, $\sqrt{5}$ , $\sqrt{5}$	$90^\circ$ , $90^\circ - \alpha$ , $90^\circ$ , $90^\circ + \alpha$

# The pieces

---

Although all pieces are asymmetric and different, they often combine to make symmetric shapes

# The pieces

---

This means that it is very rare for an Egyptian Tangram figure to have a unique solution

There are three different solutions for the square and, in all three cases, two of the corners of the square are built as a sum of acute angles!

# Why we called it the *Egyptian* Tangram?

---

The smallest pieces of the Chinese and Greek-Cross tangrams can be used to build all the other pieces...

...but you cannot do the same with  
the Egyptian Tangram because of T6

# Why we called it the *Egyptian* Tangram?

---

Initially, T6 was considered as the *leftover* piece that results from cutting all these  $1:2:\sqrt{5}$  triangles from the borders of the square.

But it turned out to be a very well known triangle...

...the **Egyptian** Triangle (3:4:5)  
and, hence, the name

# Puzzles & Activities

# Realistic figures

---

Use all five pieces to build these figures:

Gnome

Sailboat

Snowmobile

Alpine house

Teddy bear

Bow tie

Candle

Diamond

Erlenmeyer

Viking hat

Penguin

Sea Turtle

Calf

Duck

Crow

# The Remote Control Symbols

---

Use all five pieces to build these symbols:

Rewind

Play/Pause

FFWD

Start

Stop

End

Volume

# Geometric figures

---

Use all five pieces to build these figures:

# The three solutions of the square

---

Could you prove that there are just three different solutions for the square?

What's the area of this square? What's its perimeter?

How many times do you find  $\sqrt{5}$  in the Egyptian Triangle pieces?

# Figures with unique solutions

---

Could you prove that all these figures have unique solutions?

# The triangle paradox!

---

Both figures use all 5 pieces...

Where did the square go?

# The rectangle paradox!

---

Both figures use all 5 pieces...

Where did the square go?

# The Erlenmeyer paradox!

---

Both figures use all 5 pieces...

Where did the square go?

# Sum of similar figures

---

Use all 5 pieces to build the single figure in the LHS, then use them to build the two figures on the RHS

In both equations, the figures are similar and areas are in ratio 5 : 4 : 1

# Pythagoras with T1, T4 & T5

---

Since  $\text{area}(T1) + \text{area}(T4) = \text{area}(T5) \dots$

...you can verify three cases of Pythagoras' theorem  
(and these particular cases turn out to be T1, T4 & T5 right triangles!)

# Quadrilaterals

---

Simple quadrilaterals: Not self-intersecting

All simple quadrilaterals tile the plane!

$$\alpha + \beta + \gamma + \delta = 2\pi$$

# Quadrilaterals

---

**Convex quadrilaterals:** All internal angles are smaller than  $\pi$

Law of Cosines:  $p^2q^2 = a^2c^2 + b^2d^2 - 2abcd \cos(\alpha + \gamma)$

# Quadrilaterals

---

Trapeziums (UK) / Trapezoids (US): One pair of parallel sides

$$2ab + c^2 + d^2 = p^2 + q^2$$

# Quadrilaterals

---

Parallelograms: Two pairs of parallel sides

Diagonals bisect each other

$$a^2 + b^2 + c^2 + d^2 = p^2 + q^2$$

# Quadrilaterals

---

**Cyclic quadrilaterals:** All vertices lie on a circle

$$\text{Cyclic} \Leftrightarrow \alpha + \gamma = \beta + \delta$$

# Quadrilaterals

---

**Tangential quadrilaterals:** All sides are tangent to a circle

$$\text{Tangential} \Leftrightarrow a + c = b + d$$

# Quadrilaterals

---

**Isosceles Trapezoids:** Two pairs of adjacent angles are equal

Isosceles trapezoids = Cyclic quadrilaterals with equal diagonals

# Quadrilaterals

---

**Darts & Kites:** Two pairs of adjacent sides are equal

Darts/Kites = Tangential quadrilaterals with perpendicular diagonals

# Quadrilaterals

---

**Rhombi:** All sides are equal

Rhombi = Parallelograms with perpendicular diagonals

# Quadrilaterals

---

**Rectangles:** All angles are equal

Rectangles = Parallelograms with equal diagonals

# Quadrilaterals

---

Squares: Regular quadrilaterals

Among all quadrilaterals, squares maximize the *Area:Perimeter* ratio

# The Egyptian Sub-tangram

---

Build these nine figures using just  
the four triangles of the Egyptian Tangram

# The Egyptian Three-Triangle-Tangram

---

You can make 11 convex figures with T1, T4 & T5:

See: Brügger, G. (1984) "*Three-Triangle-Tangram*", Bit, 24

# The 10 triangles

---

Could you prove that there are just 10 triangles you can make with one or more pieces of the Egyptian Tangram?

How many solutions could you find for each figure?

Top row areas: 20, 16, 9, 5, 4, 1

Bottom row areas: 15, 10, 10, 6

# The 11 complex quadrilaterals

---

Could you prove that there are just 11 complex quadrilaterals you can make with all five pieces of the Egyptian Tangram?

# Mathematical Properties

# Golden Rectangle — I

---

The dashed rectangle proportions are  $1:\varphi$

where  $\varphi = \frac{1+\sqrt{5}}{2}$  is the golden ratio

# Golden Rectangle — II

---

The dashed rectangle proportions are  $1:\varphi$

where  $\varphi = \frac{1+\sqrt{5}}{2}$  is the golden ratio

# Golden Rectangle — III

---

The dashed rectangle proportions are  $1:\varphi$

where  $\varphi = \frac{1+\sqrt{5}}{2}$  is the golden ratio

# Golden Rectangle — IV

---

The dashed rectangles proportions are  $1:\varphi$

where  $\varphi = \frac{1+\sqrt{5}}{2}$  is the golden ratio

# $\varphi$ and $\sqrt{5}$ are irrational

This is a golden rectangle, which means that  $\frac{\text{base}}{\text{height}} = \varphi$ , the golden ratio.

If we remove a square, what remains is also a golden rectangle:  $\frac{\text{height}}{\text{base}-\text{height}} = \varphi$

If we assume that  $\varphi = \frac{b}{h}$ , with  $b$  and  $h$  coprime integers, then  $\varphi = \frac{h}{b-h}$  is an equivalent fraction, with a smaller integer numerator and a smaller integer denominator, which is absurd. Therefore, our initial assumption must be false.

And, since  $\varphi = \frac{1+\sqrt{5}}{2}$  is irrational,  $2\varphi - 1 = \sqrt{5}$  must be irrational too.

# The Egyptian Tangram and the $5 \times 5$ grid

---

Using the intersection point of the Egyptian Tangram...

...you can divide the square into  $5 \times 5$  smaller squares!

# You can use the grid to build other grids

---

Using the intersection points of this figure...

...you can divide the square into:

$2 \times 2$ ,  $3 \times 3$ ,  $4 \times 4$  or  $5 \times 5$  smaller squares!

# The areas of the grid

---

The relative sizes of these polygons are...

**Small Triangles:** 1

**Small Kites:** 3

**Whole Square:** 120

**Big Triangles:** 6

**Big Kites:** 8

**Octagon:** 20

# Find the 32 egyptian triangles

---

There are 32 egyptian triangles in this figure...

...they come in 4 sizes and there are 8 of each kind.

# Find the 24 $1:2:\sqrt{5}$ triangles

---

There are 24  $1:2:\sqrt{5}$  triangles in this figure...

...they come in 3 sizes and there are 8 of each kind.

## $1:2:\sqrt{5}$ incenter and $\varphi$

---

Prove that if the inradius of a  $1:2:\sqrt{5}$  triangle is 1...

...its shorter leg measures  $\varphi + 1 = \varphi^2 = \frac{3+\sqrt{5}}{2}$

## 3:4:5 **incenter**

---

If we overlay T6 and T1 as shown in the figure...

...a T1 vertex lies on the incenter of T6

# Dissecting 3:4:5 — I

---

You can use this dissection of T6 to prove that...

$$\frac{\pi}{2} = \arctan\left(\frac{1}{1}\right) + \arctan\left(\frac{1}{2}\right) + \arctan\left(\frac{1}{3}\right)$$

(consider the sum of the angles touching the vertices of T6 and divide by 2)

# Dissecting 3:4:5 — II

---

You can use this dissection of T6 to prove that...

$$\pi = \arctan(1) + \arctan(2) + \arctan(3)$$

(consider the sum of the angles touching the incenter of T6 and divide by 2)

# Dissecting 3:4:5 — III

---

You can dissect a 3:4:5 triangle into...

...a smaller 3:4:5 triangle and  
two congruent  $1:2:\sqrt{5}$  triangles

# Dissecting $1:2:\sqrt{5}$ — I

---

You can dissect a  $1:2:\sqrt{5}$  triangle into...

...a  $3:4:5$  triangle and  
two congruent  $1:2:\sqrt{5}$  triangles

# Dissecting $1:2:\sqrt{5}$ — II

---

You can dissect a  $1:2:\sqrt{5}$  triangle into...

...a 3:4:5 triangle and  
two different  $1:2:\sqrt{5}$  triangles

# Dissecting $1:2:\sqrt{5}$ — III

---

You can assemble a  $1:2:\sqrt{5}$  triangle aggregating...

...five congruent  $1:2:\sqrt{5}$  triangles  
and iterate to get the **Pinwheel tiling** of the plane

# Dissecting $1:2:\sqrt{5}$ — IV

---

You can dissect a  $1:2:\sqrt{5}$  triangle into...

...five congruent  $1:2:\sqrt{5}$  triangles, remove the central one and iterate to get the **Pinwheel fractal**

# Q4 is a cyclic quadrilateral

---

Since opposite angles add to  $\pi$ ...

...Q4 is a cyclic quadrilateral

# The circumcircles — I

---

All circumcircles pass through a common point...

...and  $C(T_6) = C(T_5)$  passes through the center of  $C(Q_4)$  &  $C(T_4)$

# The circumcircles — II

---

These circumcircles intersect at the square's center...

...which happens to be T6's incenter

# Tangent circles — I

---

These three points are aligned...

...and these two circles are tangent

## Tangent circles — II

---

The line is tangent to this circle...

...and the right triangle below is an Egyptian Triangle

# Tangent circles — III

---

The radius of these three circles are in ratio  $1:\varphi:\varphi^2$

where  $\varphi = \frac{1+\sqrt{5}}{2}$  is the golden ratio

# Tangent circles — IV

---

The radius of these two circles are in ratio  $1:\varphi^2$

where  $\varphi = \frac{1+\sqrt{5}}{2}$  is the golden ratio

# Angles of Q4 in the Golden Rhombus

---

The angles  $90 - \alpha$  and  $90 + \alpha$  that appear in Q4 also appear in the Golden Rhombus

(a rhombus whose diagonals are in proportion  $1 : \varphi$ , with  $\varphi = \frac{1+\sqrt{5}}{2}$ )

$$90 + \alpha = 2 \cdot \arctan(\varphi) = \arctan(1) + \arctan(3)$$

$$90 - \alpha = 2 \cdot \arctan\left(\frac{1}{\varphi}\right) = \arctan(2)$$

The faces of the rhombic triacontahedron and the rhombic hexecontahedron are Golden Rhombi

## Angles of $Q4 = \text{Angles of } T5 \cup T6$

Even though they are NOT similar figures...

...the same angles appear in  $Q4$  and  $T5 \cup T6$

## $\varphi$ and the perimeters T1, Q4 & T5 $\cup$ T6

---

The perimeters of T1, Q4 & T5  $\cup$  T6  
are in a geometric progression whose factor is  $\varphi$

$$\frac{2\sqrt{5} + 4}{\sqrt{5} + 3} = \frac{3\sqrt{5} + 7}{2\sqrt{5} + 4} = \varphi = \frac{1 + \sqrt{5}}{2}$$
